

Anonymize Headers

As of October the 15th, 2018 this is enabled by default.

To disguise your users details like IP, email client, etc. we have to create a new file in `data/conf/postfix/openemail_anonymize_headers.pcre` and insert the following:

```
/^s*Received:.*Authenticated sender:(.+)/  
    REPLACE Received: from localhost (localhost [127.0.0.1]) (Authenticated  
sender:$1  
/^s*User-Agent/           IGNORE  
/^s*X-Enigmail/           IGNORE  
/^s*X-Mailer/             IGNORE  
/^s*X-Originating-IP/     IGNORE  
/^s*X-Forward/            IGNORE
```

Next we need to add the following to `data/conf/postfix/main.cf`:

```
smtp_header_checks = pcre:/opt/postfix/conf/openemail_anonymize_headers.pcre
```

Then restart Postfix:

```
docker exec -it $(docker ps -qf name=postfix-openemail) postfix reload
```
