

Configuration

Several configuration parameters of the openemail UI can be changed by creating a file `data/web/inc/vars.local.inc.php` which overrides default settings found in `data/web/inc/vars.inc.php`.

The local configuration file is persistent over updates of openemail. Try not to change values inside `data/web/inc/vars.inc.php`, but use them as template for the local override.

openemail UI configuration parameters can be used to...

- ...change the default language | ¹
- ...change the default bootstrap theme
- ...set a password complexity regex
- ...enable DKIM private key visibility
- ...set a pagination trigger size
- ...set default mailbox attributes
- ...change session lifetimes
- ...create fixed app menus (which cannot be changed in mailcow UI)
- ...set a default "To" field for relayhost tests
- ...set a timeout for Docker API requests
- ...toggle IP anonymization

1. To change SOGo's default language, you will need to edit `data/conf/sogo/sogo.conf` and replace "English" by your preferred language.
