

Maildir

Backup

This line backs up the vmail directory to a file backup_vmail.tar.gz in the openemail root directory:

```
cd /path/to/openemail-dockerized
docker run --rm -i -v $(docker inspect --format '{{ range .Mounts }}{{ if
eq .Destination "/var/vmail" }}{{ .Name }}{{ end }}{{ end }}' $(docker-
compose ps -q dovecot-openemail)):vmail -v ${PWD}:/backup debian:stretch-
slim tar cvfz /backup/backup_vmail.tar.gz /vmail
```

You can change the path by adjusting \${PWD} (which equals to the current directory) to any path you have write-access to. Set the filename backup_vmail.tar.gz to any custom name, but leave the path as it is. Example: [...] tar cvfz /backup/my_own_filename_.tar.gz

Restore

```
cd /path/to/openemail-dockerized
docker run --rm -it -v $(docker inspect --format '{{ range .Mounts }}{{ if
eq .Destination "/var/vmail" }}{{ .Name }}{{ end }}{{ end }}' $(docker-
compose ps -q dovecot-openemail)):vmail -v ${PWD}:/backup debian:stretch-
slim tar xvfz /backup/backup_vmail.tar.gz
```
