Apple macOS / iOS

Method 1 via Mobileconfig

Email, contacts and calendars can be configured automatically on Apple devices by installing a profile.

Method 1.1: IMAP, SMTP and Cal/CardDAV

This method configures IMAP, CardDAV and CalDAV.

1. Download and open the file from *https://${OPENEMAIL_HOSTNAME}/ mobileconfig.php*openemail.mobileconfig.

2. Enter the unlock code (iPhone) or computer password (Mac).

3. Enter your email password three times when prompted.

Method 1.2: IMAP only

This method configures IMAP only.

1. Download and open the file from *https://${OPENEMAIL_HOSTNAME}/mobileconfig.php? only_email*openemail.mobileconfig.

2. Enter the unlock code (iPhone) or computer password (Mac).

3. Enter your email password when prompted.

Method 2 (Exchange ActiveSync emulation)

On iOS, Exchange ActiveSync is also supported as an alternative to the procedure above. It has the advantage of supporting push email (i.e. you are immediately notified of incoming messages), but has some limitations, e.g. it does not support more than three email addresses per contact in your address book. Follow the steps below if you decide to use Exchange instead.

1. Open the *Settings* app, tap *Mail*, tap *Accounts*, tap *Add Acccount*, select *Exchange*.

2. Enter your email address ( ) and tap *Next*.

3. Enter your password, tap *Next* again.

4. Finally, tap *Save*.
