Disable Sender Addresses Verification

New guide

Edit a mailbox and select "Allow to send as *".

For historical reasons we kept the old and deprecated guide below:

Deprecated guide

This option is not best-practice and should only be implemented when there is no other option available to achieve whatever you are trying to do.

Simply create a file `data/conf/postfix/check_sasl_access` and enter the following content. This user must exist in your installation and needs to authenticate before sending mail.

```
user-to-allow-everything@example.com OK
```

Open `data/conf/postfix/main.cf` and find `smtpd_sender_restrictions`. Prepend `check_sasl_access hash:/opt/postfix/conf/check_sasl_access` like this:

```
smtpd_sender_restrictions = check_sasl_access hash:/opt/postfix/conf/
check_sasl_access reject_authenticated_sender_login_mismatch [...]
```

Run postmap on check_sasl_access:

```
docker-compose exec postfix-openemail postmap /opt/postfix/conf/check_sasl_access
```

Restart the Postfix container.
